

DMT.

before 11/11/66. DMT up to 1.0 g p.05. David Poole (friend of Randle)

5/28/76 Constructed cigarettes, a few milligrams of finely powdered Tanacetum Vulgare are appropriately distributed on paper, and the free base (20mg, 100mg) evenly distributed and mixed. Direct heat [with] an infrared lamp melts the base, and the sl. sticky mix is rolled into a v.tight and small diameter cigarette (4-5mm dia.) The length is marked off to determine the quantity taken. All experiments separated by ~2hrs.

- > (5mg) (inhalation) n.e.
- > (15mg) (inhalation) n.e.
- > (20mg) (inhal) after ~30 sec. a strange light headed-ness starts - possibly [with] some temporal pressure. neat effect and there is a "quantitative" awareness of the measure of the intensity - no visual - no sensory distortion - just very much in its control. max at 3min, then rapid disappearance. Out at 7min.
- > (30mg) (inhal) within 30 sec. start. - Build up to max.(?) intensity at 2 - 2 1/2 min. some yellowing of visual field - complete control given to drug - but there is nothing to do! - no eyes closed - no imagery - the intense plateau is left at 3-4min - still "up" but there is a clear awareness of the rate of recovery - the radio is apparent again. 8 minutes OUT.
- > (20mg + 10 + 10 + 10) Attempt to maintain the 3-4 minute effect of the 30mg experience above by chronic reinforcement. 20mg was inhaled - followed in a minute by 10mg - redevelopment of the strongly intoxicated state (but not back to the "yellow" degree) and as the effect starts waning, reinforce [with] 10mg (at 4 min) again at 8 min and here the effects seem to be a little smoothed out - next (and last) reinforcement at 13min (10mg) which maintained effects for a few more minutes. rapid clearance and completely out at 20 minutes. No residual effects. a completely stupid drug.
